

TRAFFIC SAFETY FACTS

2011 Data

DOT HS 811 776

May 2013

State Alcohol-Impaired Driving Estimates

This fact sheet contains estimates of driver alcohol involvement in fatal crashes for the United States and individually for the 50 States, the District of Columbia, and Puerto Rico in 2011. For comparison, data from 10 years ago (2002) are also presented. These estimates are based on data from NHTSA's Fatality Analysis Reporting System (FARS). Unfortunately, known blood alcohol concentration (BAC) test results are not available for all drivers involved in fatal crashes. Missing data can result for a number of reasons, the most frequent of which is that people are not always tested for alcohol.

To address the missing data issue, NHTSA uses a statistical model called "multiple imputation" to estimate the blood alcohol concentration (BAC) of the driver at the time of the crash. The statistical model is based on important characteristics of the crash including crash factors (e.g., time of day, day of week, type of crash, location); vehicle factors (e.g., vehicle type and role in the crash); and person factors (e.g., age, sex, restraint use, previous driving violations); and most importantly, the subjective assessment of the police officer at the scene of the crash as to whether alcohol was involved or not. For more information on multiple imputation see <http://www-nrd.nhtsa.dot.gov/Pubs/809-403.pdf>, NHTSA's Technical Report (DOT HS 809 403) "Transitioning to Multiple Imputation – A New Method to Impute Missing Blood Alcohol Concentration (BAC) values in FARS."

The statistical model was developed using all available known data in the aggregate (that is, at the national level) and applied to each individual driver and nonoccupant with an unknown BAC test result. However, the estimates presented in this fact sheet focus on driver alcohol involvement only.

All 50 States, the District of Columbia, and Puerto Rico have by law created a threshold making it illegal per se to drive with a BAC of .08 grams per deciliter (g/dL) or higher.

Drivers are considered to be alcohol-impaired when their BAC is .08 g/dL or higher. Thus, any fatality occurring in a crash involving a driver with a BAC of .08 or higher is considered to be an alcohol-impaired driving fatality. The term "driver" refers to the operator of any motor vehicle, including a motorcycle. The term "alcohol-impaired" does not indicate that a crash or a fatality was caused by alcohol impairment.

Great caution should be exercised in comparing the levels of alcohol involvement among States. Differences in alcohol involvement can be due to any number of factors not necessarily directly related to a State's alcohol traffic safety program. Factors affecting alcohol involvement in fatal crashes include:

- Population demographics and the economic environment (older drivers and female drivers exhibit lower levels of alcohol involvement; drivers of older vehicles exhibit higher levels of alcohol involvement); and

For more information:

Information on traffic fatalities is available from the National Center for Statistics and Analysis (NCSA), NVS-424, 1200 New Jersey Avenue SE., Washington, DC 20590. NCSA can be contacted on 800-934-8517 or via the following e-mail address: ncsaweb@dot.gov. General information on highway traffic safety can be accessed by Internet users at www.nhtsa.gov/NCSA. To report a safety-related problem or to inquire about motor vehicle safety information, contact the Vehicle Safety Hotline at 888-327-4236.

Other fact sheets available from the National Center for Statistics and Analysis are *Alcohol-Impaired Driving, Bicyclists and Other Cyclists, Children, Large Trucks, Motorcycles, Occupant Protection, Older Population, Overview, Passenger Vehicles, Pedestrians, Race and Ethnicity, Rural/Urban Comparisons, School Transportation-Related Crashes, Speeding, State Traffic Data, and Young Drivers*. Detailed data on motor vehicle traffic crashes are published annually in *Traffic Safety Facts: A Compilation of Motor Vehicle Crash Data from the Fatality Analysis Reporting System and the General Estimates System*. The fact sheets and annual Traffic Safety Facts report can be accessed online at www-nrd.nhtsa.dot.gov/CATS/index.aspx.

- Types of vehicles (motorcycle riders tend to exhibit the highest levels of alcohol involvement followed by drivers of light trucks; drivers of large trucks tend to exhibit the lowest levels of alcohol involvement).

One of the major differences among States is in the degree of testing for drivers involved in fatal traffic crashes. These differences in testing affect the accuracy and reliability of the estimates presented, and for 2011 range from a low of 26-percent known BACs to a high of 93-percent known BACs. States with higher rates of known BACs yield estimates of fatal crash alcohol involvement with greater accuracy and precision.

State-by-State Data Tables

Tables provided in these sections show estimates of alcohol-impaired driving for the Nation and on a State-by-State basis for 2002 and 2011 using NHTSA's multiple imputation model applied to the FARS data. Estimates for Puerto Rico are not included in the national totals. The estimates presented represent the combination of known and estimated BACs. Estimates in Tables 1 through 4 are presented for four categories:

- (1) BAC of .00
- (2) BAC of .01 to .07
- (3) BAC of .08 or greater (alcohol-impaired)
- (4) BAC of .01 or greater

Fatalities by Highest Driver BAC in the Crash (Tables 1 and 2) – Nationwide in 2011, alcohol-impaired driving was involved in 31 percent of traffic fatalities, translating to 9,878 alcohol-impaired driving fatalities. In 2002, alcohol-impaired driving was also involved in 31 percent of traffic fatalities, however, that percentage represented 13,472 alcohol-impaired driving fatalities. Tables 1 and 2 provide these comparisons for each State and the Nation as a whole.

Drivers Involved in Fatal Crashes by BAC of the Driver (Tables 3 and 4) – Nationwide in 2011, 21 percent (9,296) of the drivers involved in fatal crashes were alcohol-impaired. In 2002, 21 percent (12,405) of the drivers involved in fatal crashes were alcohol-impaired. Tables 3 and 4 provide national and State data for drivers.

BAC Test Status (Tables 5 through 9) – This section presents the percentage of drivers involved in fatal crashes where BAC tests were given and the results were in the FARS file. Individual tables are presented for all drivers, fatally injured drivers, and surviving drivers.

Nationwide in 2011, a total of 15,025 (72%) fatally injured drivers out of 20,753 had BAC test results, compared to 70 percent in 2002. For surviving drivers, BAC test results were known for 6,864 (30%) of the 22,915 drivers. Overall in 2011, FARS contained BAC test results for 21,889 (50%) of the 43,668 drivers involved in fatal crashes, slightly up from 47 percent in 2002. The higher the proportion of drivers with known BAC test results, the more reliable the State estimates.

State-Level Estimates on a Regional Basis (Table 10) – For the States in the various NHTSA regions, the following table summarizes the estimated percentages of fatalities that were alcohol-impaired (BAC of .08 or greater) in 2002 and 2011, and the estimated percentage of drivers with BACs of .08 or greater involved in fatal crashes.
