1. Executive Summary

Rural areas account for 71 percent of the Nation's public road miles and see nearly half of crash fatalities. With vast road miles to consider, this report quantifies the extent of fatalities in the first 15 miles outside of urban areas (UAs).

- Fifty-nine percent of rural crash fatalities occur within 5 miles of UAs; this density tapers as distance from UAs increases. This distribution varies across States.
- Half of crash fatalities occur in UAs (50%).
- Almost 80 percent of fatalities occur in UAs and the 5 surrounding miles (79%).

While total crash fatalities increased 11 percent from 2010 to 2018, fatalities within UAs increased 20 percent (14,988 in 2010, 17,975 in 2018). The percentage of crash fatalities within UAs also increased 4 percentage points, 46 percent to 50 percent.

Some crash factors show up more prominently in certain locations. Fatalities in crashes involving rollovers and large trucks report lower percentages in UAs but higher than National percentages in the 10- to 15-mile buffers in rural areas. Fatalities in crashes involving motorcycles, pedalcyclists, and pedestrians report higher percentages in UAs.

2. Background and Introduction

NHTSA's Fatality Analysis Reporting System (FARS) started collecting latitude and longitude data in 2001. NHTSA annually releases traffic safety fact sheets on the Rural/Urban Comparison (<https://crashstats.nhtsa.dot.gov/Api/Public/ViewPublication/812741>). The most recent 5-year average shows approximately a 50-50 split in rural and urban motor vehicle (MV) traffic fatalities, specifically 48 and 51, respectively, seen in Table 1.

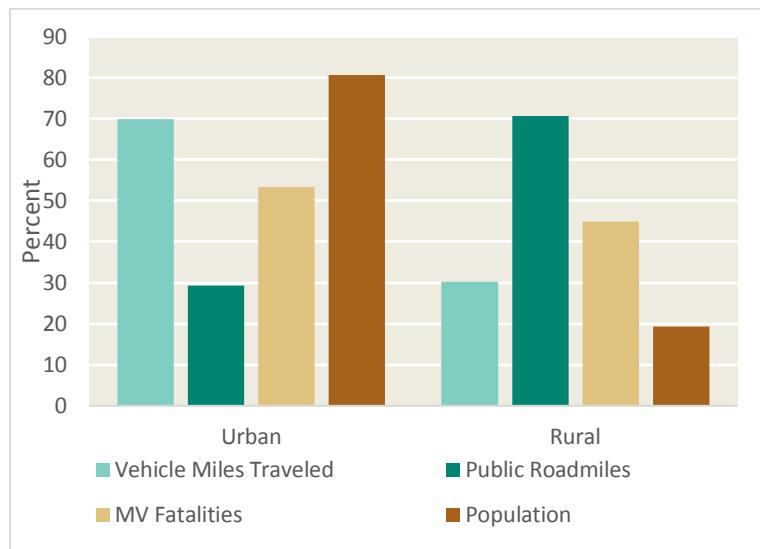

Table 1. Crash Fatalities by Location in FARS and Year, 2014-2018*

YEAR	RURAL (%)	URBAN (%)
2018	44.9	53.3
2017	46.4	53.3
2016	48.5	51.2
2015	49.9	49.5
2014	51.3	48.6

Source: FARS 2014-2017, FARS 2018 Annual Report File

*Unknowns not shown, totals do not sum to 100 percent.

Figure 1. People and Roads by Location, 2018

Sources: FARS 2018 ARF; 2010 Census; FHWA OHPI, Highway Statistics

Rural areas see nearly half of crash fatalities and account for 71 percent of the Nation's public road miles, shown in Figure 1. With vast road miles to consider, this report quantifies the extent of fatalities in the first 15 miles outside of UAs. This report is an update to a 2009 NHTSA report, *Geospatial Analysis of Rural Motor Vehicle Traffic Fatalities* (Subramanian, 2009).

National and overall State summaries are presented in the following sections. Fatality percentages are reported in 2.5-mile increments out to 15 miles outside of UAs. Crash factor-related subcategories of interest are presented as a national summary. State by State tables can be found in the Appendix.

3. Data and Methods

Table 2. Percentage of Fatal Crashes With Valid Latitude and Longitude Information by Year, 2010-2018

FARS Year	Useable Lat/Long Data (%)
2010	98.8
2011	98.6
2012	98.9
2013	98.8
2014	99.5
2015	99.6
2016	99.6
2017	99.5
2018	99.2

Source: FARS 2010-2017, FARS 2018 Annual Report File

FARS is a nationwide census of fatal crashes on public roadways in which the fatality occurred within 30 days of the crash. This report uses FARS 2010-2017 and the 2018 FARS Annual Report File (ARF). The analysis uses the latitude-longitude data as reported in FARS; less than 1 percent of the data reported is not usable in geospatial analysis and was omitted. Examples of unusable latitude and longitude are those falling outside of the United States, not reported, not available, or reported as “unknown.” Table 2 shows the percentage of crashes with usable latitude and longitude data for the study years.

Every 10 years the Census Bureau delineates UAs and makes them available via TIGER/Line shapefiles.

“The Census Bureau's urban areas represent densely developed territory, and encompass residential, commercial, and other non-residential urban land uses. For the 2010 Census, an urban area will comprise a densely settled core of census tracts and/or census blocks that meet minimum population density requirements, along with adjacent territory containing non-residential urban land uses as well as territory with low population density included to link outlying densely settled territory with the densely settled core. To qualify as an urban area, the territory identified according to criteria must encompass at least 2,500 people, at least 1,500 of whom reside outside institutional group quarters.

The Census Bureau identifies two types of urban areas:

- Urbanized Areas of 50,000 or more people;
- Urban clusters (UCs) of at least 2,500 and less than 50,000 people.”
(Census, 2012)

This report uses the term urban areas to include both urbanized areas and urban clusters.

NHTSA used Esri ArcGIS Pro software to generate buffers around Census-defined UAs in 2.5 mile increments, out to 15 miles. As an example, the various UAs surrounding the Washington, DC – VA – MD Urbanized Area (highlighted), and their buffers and their relationships are seen below in Figure 2. Using the FARS latitude-longitude data each crash was assigned a value indicating its proximity to an urban area as follows.

- Urban Area
- 0-2.5 Miles Outside UA
- 2.5-5 Miles Outside UA
- 5-7.5 Miles Outside UA
- 7.5-10 Miles Outside UA
- 10-12.5 Miles Outside UA
- 12.5-15 Miles Outside UA
- 15+ Miles Outside UA

Figure 3 illustrates this for the Washington, DC, area with the binary Rural / Urban classification of a crash indicated by color.

Figure 2. Washington, DC – VA – MD Urbanized Area and Surrounding Urban Areas With Incremental 2.5-Mile Buffers

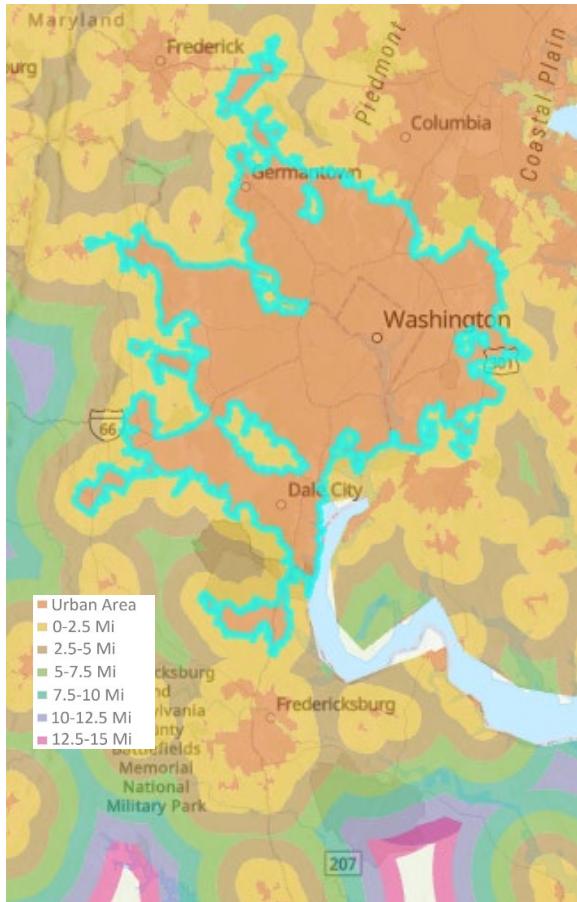

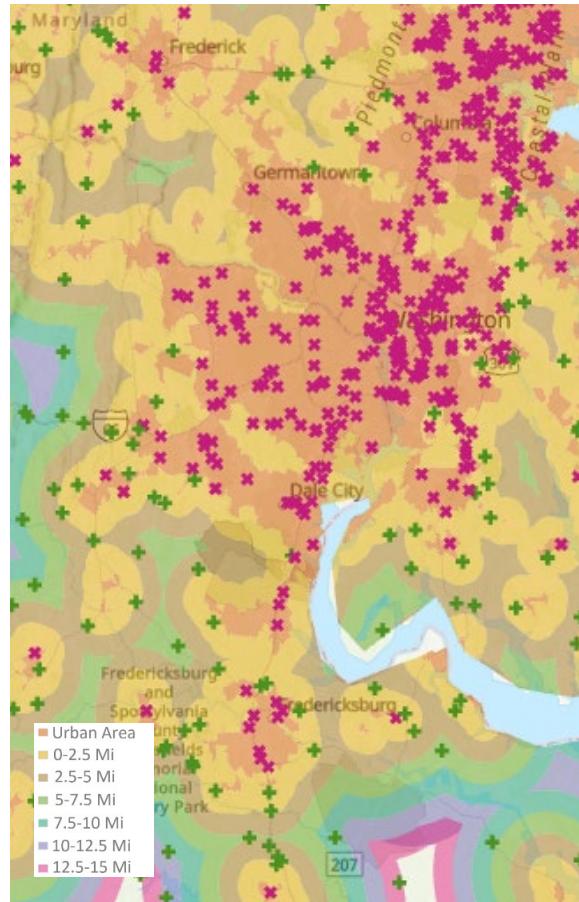

Figure 3. Fatal Crash Locations (Rural/Urban) With Urban Areas and Incremental 2.5 Mile Buffers near Washington, DC, 2018

Source: Census TIGER/Line Urban Area 2010, FARS 2018 ARF

Fatality percentage summaries will be reported for these spatial categories throughout the remainder of this report.

All 50 States are included in both FARS and TIGER. Washington, DC, is an entirely urban area, so all its fatalities occur in an urban area.

The results section summarizes these sub-categories of interest.

- Rollover-involved fatalities
- Large-truck-involved fatalities
- Single-passenger vehicle (PV) crash fatalities
- Fatalities on U.S. and State highways

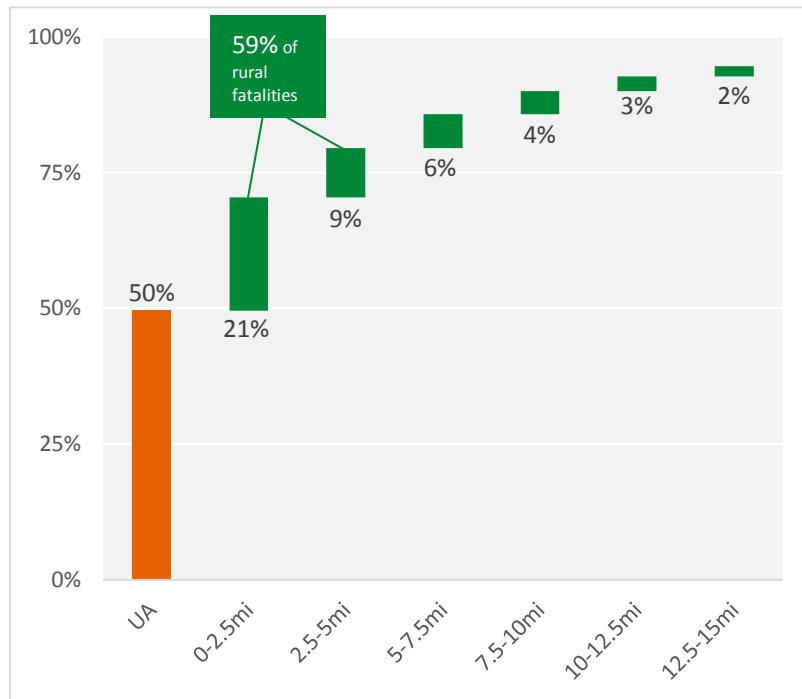

- Unrestrained fatalities
- Distraction-involved fatalities
- Speeding-related fatalities
- Weekend fatalities
- Fatalities on interstates
- Alcohol-impaired-driving fatalities
- Nighttime fatalities
- Crash fatalities involving motorcycles, pedalcyclists and pedestrians

State by State tables are available in the Appendix.

4. Results

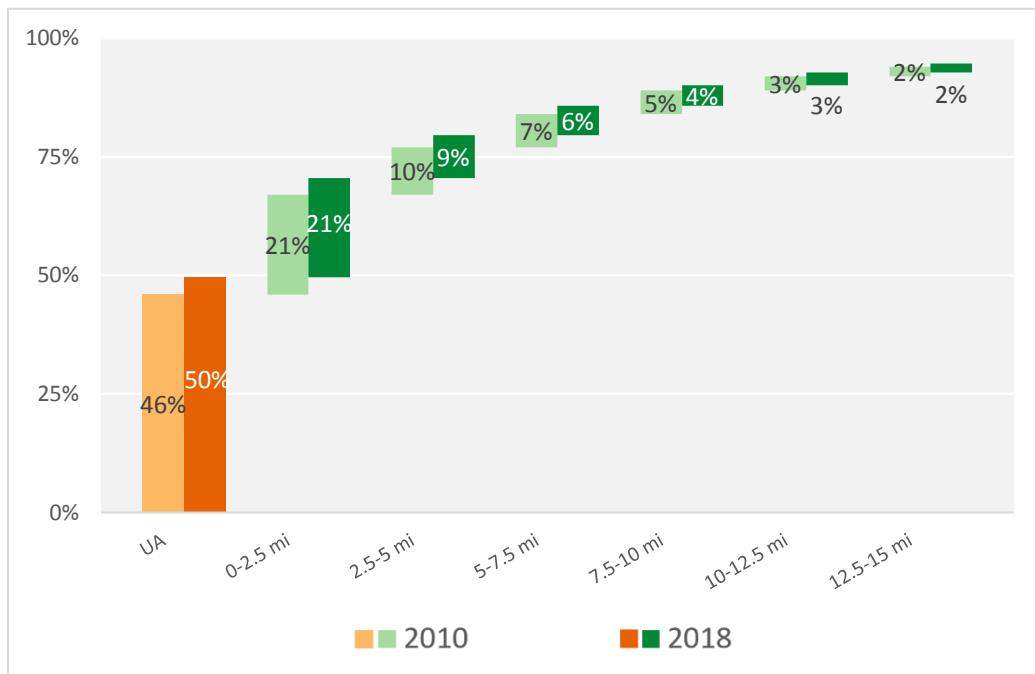

Fifty-nine percent of rural crash fatalities occur within 5 miles of UAs; this density tapers as distance from UAs increases, shown in Figure 4. Half of crash fatalities occur in UAs (50%). Forty-one percent of rural fatalities occur within 2.5 miles of UAs. Almost 80 percent of fatalities occur in UAs and the 5 surrounding miles (79%).

Figure 5. Crash Fatalities by Incremental 2.5-Mile Buffers, 2010 and 2018

Sources: 2010 FARS, 2018 FARS ARF, 2010 Census Urban Area TIGER/Line Shapefile

Change Over Time: 2010-2018

While total crash fatalities increased 11 percent from 2010 to 2018, fatalities within UAs increased 20 percent (14,988 in 2010, 17,975 in 2018). The percentage of crash fatalities within UAs also increased 4 percentage points, 46 percent to 50 percent, seen in Figure 5. Across all years, 21 percent of fatalities occurred in the 2.5 miles outside of UAs, seen in Table 3. Excluding the increase in fatalities in UAs the overall spatial distribution of crashes has remained similar over the time considered.

Table 3. Percentages of Crash Fatalities Across Incremental 2.5-Mile Buffers by Year, 2010-2018

Variation Across States, 2018

Fifty-nine percent of rural fatalities nationwide occur within the first 5 miles outside UAs. This varies across the States, as can be seen in Figure 6. The first column lists each State with a color to the left. In the second column, in the same color is the percentage of rural fatalities occurring within 5 miles of UAs. The national value of 59.3 percent is shown as a dashed line. The third column represents the number of fatalities within 5 miles of UAs. The map in the far right column highlights each State and fills in cumulatively from the top.

With low percentages of rural fatalities occurring in the first 5 miles outside UA States like Wyoming (16%, 16 fatalities), North Dakota (20%, 19 fatalities), and Montana (24%, 36 fatalities) are seen at the top. Texas is highlighted with the median value of 56 percent and the highest count of 1,051 fatalities. Higher percentages of rural fatalities occurring in the first 5 miles outside UAs are seen in States like New Jersey (97%, 106 fatalities) and Delaware (95%, 40 fatalities) at the bottom. Washington, D.C. is at the very bottom, undefined as all their fatalities occur in UAs.

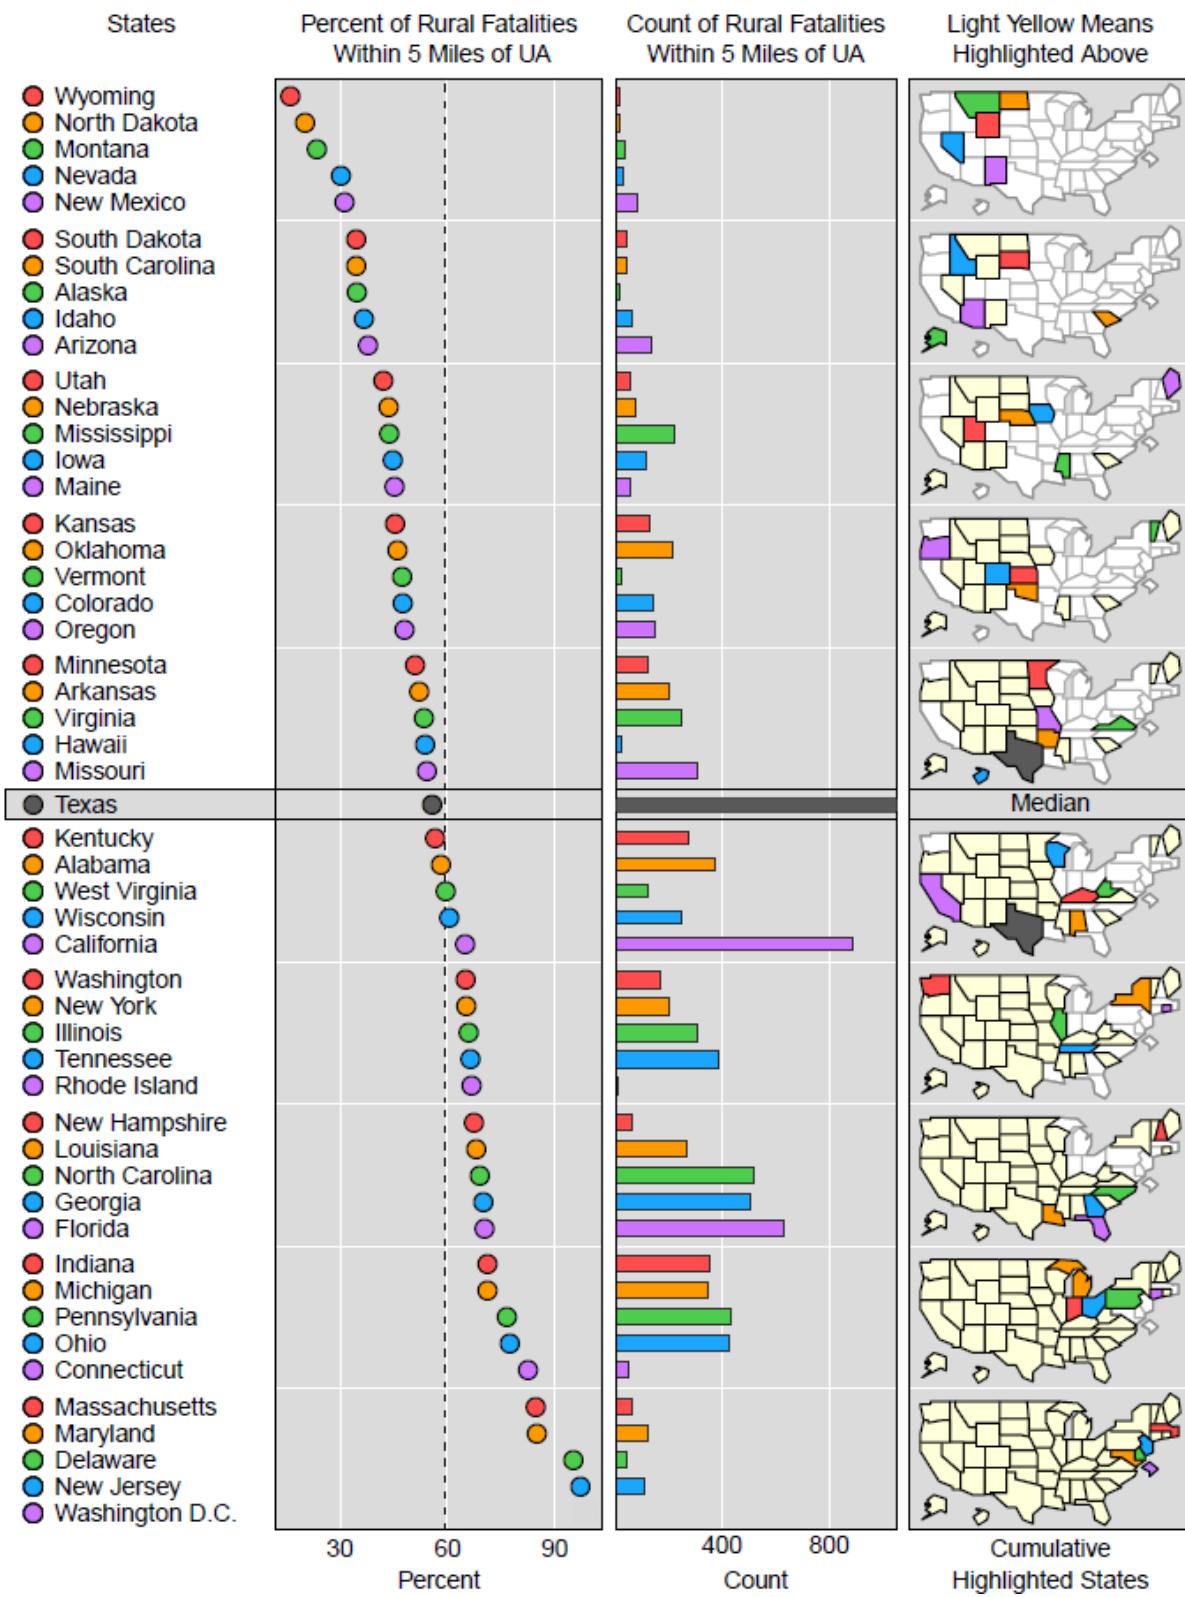

A detailed State summary can be found in Table A1 in the appendix.

Subcategories of Interest, 2018

Various crash attributes related to the people (occupants, non-occupants, drivers), vehicles (large trucks, passenger vehicles, motorcycles) and roadways (interstates, U.S./State highways) involved are more prominent in certain areas. The spatial distribution of crash fatalities within the first 15 miles of UAs associated with a variety of subcategories is shown in Figure 7. The subcategories are ordered by ascending percentages of fatalities within UAs, with the total crash fatality distribution near the center. Fatalities in crashes involving rollovers and large trucks report lower percentages in UAs but higher percentages in the 10- to 15-mile buffers. Fatalities in crashes involving motorcycles, pedalcyclists, and pedestrians report high percentages in UAs.

These attributes also vary widely across the Nation. A detailed State summary on each of the attributes in Figure 7 can be found in the appendix.

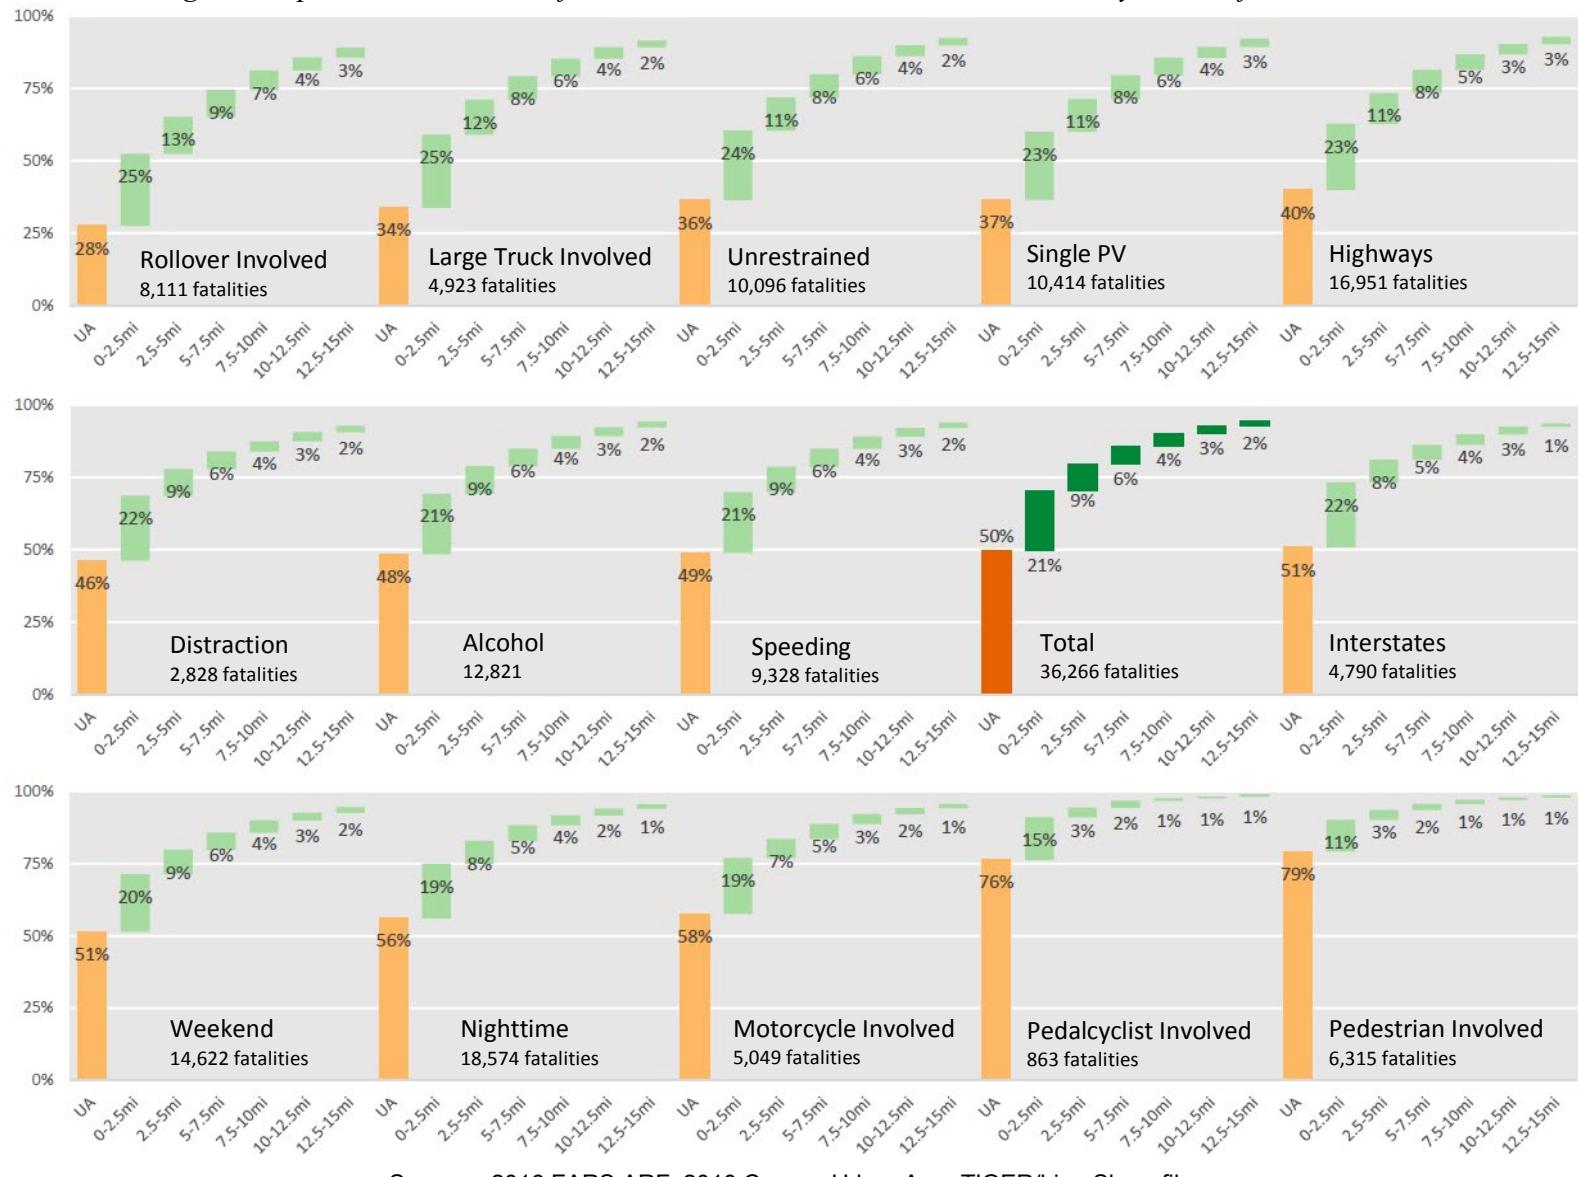

Figure 6. Rural Crash Fatalities Within 5 Miles of Urban Areas, 2018

Note: National value of 59.3% is shown above as a dashed line.

5. Discussion and Limitations

All latitudes and longitudes are projected as reported in FARS. This report uses the Census 2010 UAs and all location coding is made on a national level. FARS code urbanicity is based on Federal Highway Administration definitions. These definitions vary slightly and latitude/longitude reporting varies across States (see Table A16), as such counts and percentages of rural and urban crashes in this report may differ slightly from those reported in FARS.

While UAs account for 3.1 percent of the total land area, without a complete national roadway network, NHTSA has no way to quantify the roadway or lane miles in each of the various buffers. So, while we report 59 percent of rural fatalities occur within the 5 miles adjacent to UAs we are unable to quantify the road mileage within these areas.

Census UAs are only updated every 10 years. The urban population saw growth from 2000 to 2010 as 9.7 percent U.S. total population growth (Census, 2012), as has been the trend for the last century. This suggests the further we get from the Census data year, the less accurate is that year's representation. Consider 2010: The 2010 UAs are accurate for 2010 FARS, but by 2018 the 2010 UAs may be less representative of the 2018 population.

It should be noted that due to the density and size of some States, they were fully enveloped by various buffers (Delaware – 10-mile buffer; New Jersey – 12.5-mile buffer; Rhode Island – 15-mile buffer; Massachusetts - 15-mile buffer). Please see Figures 2 and 3 for how these buffers relate.
